#### Description

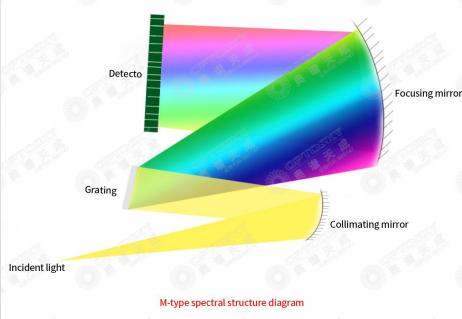

ATP5030/4 is a cooled, ultra-high resolution micro spectrometer newly developed by Optosky, ATP5030/4 is based on the M-type optical path structure independently developed by Optosky, with extraordinary ultra-high resolution; at the same time, it uses a cooled 2048 or 4096 pixel linear array detector to achieve the ultimate ultra-high resolution, the highest resolution can reach 0.05nm, It is a miniature spectrometer suitable for various high-resolution applications, with high reliability, ultra-high speed, low cost, and high cost performance. It can be adapted to various environmental uses such as online testing.

ATP5030/4 adopts TEC electric cooling, the cooling temperature is -5°C. Greatly reduce the dark current and noise of the spectrometer, and improve the dynamic range and signal-to-noise ratio of the spectrometer.

ATP5030 can receive SMA905 optical fiber input light or free space light, and output the measured spectrum data through USB2.0 or UART port.

ATP5030 only needs a 5V DC power supply, which is very easy to integrate and use.
